South Tangerang, Indonesia

Frontend Engineer with 3+ years of experience specializing in React ecosystem and performance optimization. Skilled in re-engineering legacy codebases into scalable modern architectures, delivering measurable impacts like reducing bundle sizes by 90% and optimizing rendering for massive datasets. Passionate about building robust internal tools (Custom Editors, Form Builders) that enhance user experience and developer productivity

Work Experience

PT Indodev Niaga Internet - South Tangerang, Indonesia

Feb 2023 - Present

Frontend Engineer

- Migrated rich text editor from Quill, SunEditor to custom Tiptap (ProseMirror) in React, built custom extensions for stable JSX rendering, eliminated inconsistencies, improved performance and stability, and documented with JSDoc
- Re-engineered Ant Design Transfer v4 to support desktop-like interactions (drag-select, shift-click, double-click transfer); leveraged Map/Set structures for efficient data lookups and useRef for rendering stability, ensuring lag-free manipulation for 80k+ items
- Built a GUI-based Form Customizer enabling dynamic configuration of 20+ field types, eliminating the need for frontend code changes and speeding up implementation cycles
- Built a dependency-free Markdown Editor, implementing custom DOM logic to preserve cursor state and native undo/redo history while minimizing bundle size
- Re-engineered the internal Chatbot Widget from scratch, transforming a bloated legacy codebase into a streamlined React implementation that reduced bundle size by ~90% (2.5MB → 244KB) while adding resilient offline handling and auto-reconnection features
- Translated complex Figma designs into pixel-perfect React components, building a library of reusable UI elements that accelerated feature delivery
- Optimized Ant Design form architecture by replacing Form.useWatch with local state management (useState/useRef), eliminating unnecessary full-page re-renders and improving input responsiveness
- Delivered 5+ React onboarding sessions for new hires on core concepts (Hooks, State Management) to enforce internal frontend best practices
- Resolved critical circular dependencies using Madge for visualization, systematically refactoring module boundaries to eliminate runtime crashes and improve build stability

Education

Padang State Polytechnic - Padang, Indonesia

Jul 2019 - Dec 2023

Bachelor of Applied Science in Software Engineering, 3.77/4.00

- Built a full-stack decision support system (React/Express/MySQL) implementing AHP & EDAS algorithms to rank thesis supervisors based on weighted multi-criteria evaluation.
- Engineered a document fingerprinting engine using the Winnowing Algorithm to calculate semantic relevance between student proposals and lecturer research history.

Skills

- **Programming Languages:** Javascript, Typescript
- **Frontend Frameworks:** React.js, Zustand, Ant Design, Tailwind CSS, Styled Components, LESS
- **Tools & Performance:** Vite, Git, Madge, Chrome DevTools, React DevTools
- **Interest:** Game Development (Roblox Luau Scripting), Backend Engineering (Learning Go/SQL)
